                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US-10-501-814-3

Sequence 3, Application US/10501814

Publication No. US2006008827A1

SEQUENCE 3. Publication No. US2006008827A1

APPLICANT: Evotec NeuroSciences GmbH

APPLICANT: Evotec NeuroSciences GmbH

TITLE OF INVENTION: Diagnostic and therapeutic use of a voltage-gated ion

TITLE OF INVENTION: Channel for neurodegenerative diseases

FILE REFERENCE: P67564US1

CURRENT APPLICATION NUMBER: US/10/501,814

CURRENT FILING DATE: 2004-07-19

NUMBER OF SEQ ID NOS: 15

SOFTWARE: PatentIn Ver. 2.1

-1- SUBCELLULAR LOCATION: Secreted protein.
-1- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                         TISSUE=Bone marrow;

*Protegrins: leukocyte antimicrobial peptides that combine features of corticostatic defensins and tachyplesins.";

FEBS Lett. 327:231-236(1993).

-!- FUNCTION: Microbicidal activity. Active against B.coli, Listeria monocytogenes and C.albicans, in vitro.

-!- SUBCELLULAR LOCATION: Secreted protein.

-!- SUBCELLULAR LOCATION: Secreted protein.

-!- CATALYTIC ACTIVITY: ATP + L-glutamyl-tRNA(Gln) + L-glutamine = ADP + phosphate + L-glutaminyl-tRNA(Gln) + L-glutamate.
-!- CATALYTIC ACTIVITY: ATP + L-aspartyl-tRNA(An) + L-glutamine = ADP + phosphate + L-asparaginyl-tRNA(An) + L-glutamate.
-!- SUBUNIT: Heterotrimer of A, B and C subunits (By similarity).
-!- SIMILARITY: Belongs to the gatB/gatE family. GatB subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pridecte R.D., Berger B., Desiere F., Vilanova D., Barretto C., Pittet A.-C., Zwahlen M.-C., Rouvet M., Altermann B., Barrangou R., Mollet B., Mercenier A., Klaenhammer T., Arigoni F., Schell M.A.; The genome sequence of the probletic intestinal bacterium Lactobacillus johnsonii NCC 533."; proc. Natl. Acad. Sci. U.S.A. 101:2512-2517(2004).

-!- FUNCTION: Allows the formation of correctly charged Asn-tRNA(Asn) or Glu-tRNA(Gln) through the transamidation of misacylated AsptrNA(Asn) or Glu-tRNA(Gln) in organisms which lack either or both of asparaginyl-tRNA or glutaminyl-tRNA synthetases. The reaction takes place in the presence of glutamine and ATP through an activated phospho-Asp-tRNA(Asn) or phospho-Glu-tRNA(Gln) (By
                                                                                Gapa
                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               476 Aspartyl/glutamyl-tRNA(Asn/Gln)
amidotransferase subunit B.

-!- FUNCTION: Protamines substitute for histones in the chromatin of
sperm during the haploid phase of spermatogenesis. They compact
sperm Aninc a highly condensed, stable and inactive complex.
-!- SUBCELLULAR LOCATION: Nucleus.
-!- TISSUE SPECIFICTY: Testis.
-!- SIMILARITY: Belongs to the protamine Pl family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MUCLEOTIDE SEQUENCE [GENOMIC DNA].

Proc. R. Soc. Lond., B. Biol. Sci. 259:7-14 (1995).
I. FUNCTION: Protamines Bubstitute for histones in the chromatin of sperm during the haploid phase of spermatogenesis. They compact sperm DNA into a highly condensed, stable and inactive complex.
I. SUBCELLULAR LOCATION: Nucleus.
I. TISSUE SPECIFICITY: Testis.
I. SIMILARITY: Belongs to the protamine Pl family.

"Intergeneric relationships among Macropodoidea (Metatheria:
Diprotodontia) and the chronicle of kangaroo evolution.";

J. Mammal. Evol. 7:213-237(2000).

-I. FUNCTION: Protamines substitute for histones in the chromatin of sperm during the haploid phase of spermatogenesis. They compact sperm during the haploid phase of stable and inactive complex.

-I. SUBCELLULAR LOCATION: Nucleus.

-I. SISSUE SPECIFICITY: Testis.

-I. SIMILARITY: Belongs to the protamine Pl family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
